WEB LOG ANALYSIS USING WEBALIZER

Aim

To examine web server log files and analyze their contents using the Webalizer tool.

Requirements

Webalizer for Windows, a web server log file, Windows operating system, and a web browser.

Procedure

1. Launch the Windows version of Webalizer.
2. Obtain or download a sample web server log file.
3. Choose the log file and set the required configuration options.
4. Select **Run Webalizer** to analyze the log data.
5. Open the generated HTML report in a browser and review the displayed statistics.

Web Log

A web log is a record of requests sent to a web server. It may contain details such as the client IP address, request date and time, requested URL, HTTP status code, and quantity of data transferred.

Webalizer

Webalizer is a tool for analyzing web server logs. It processes log files and produces HTML reports containing statistics and graphical summaries.

Parameters Analyzed

• Visitor and visit counts
• Total requests and pages viewed
• Amount of data transferred
• Most frequently requested URLs
• Referring websites
• HTTP status codes
• Daily, monthly and hourly traffic information

Input

A web server log file containing information about requests and website traffic.

Output

Webalizer produces an HTML report summarizing visitors, requests, page views, traffic volume, popular URLs, referrers and other usage statistics.

Observation

The selected web log was processed by Webalizer, which generated statistics about website traffic, visitors, requests, pages accessed and data transfer.

Result

Thus, the web server log was analyzed successfully using Webalizer, and statistical and graphical reports were generated.
